December 2021 Observing Report

Bear Valley Springs

Astronomy Club

Planets:

Mercury – Behind Sun

Venus, Saturn & Jupiter – Getting lower in the Southwest in the early evening. Mars – Becoming visible in morning eastern sky.

Moon:

New– Dec 031st Quarter– Dec 10Full– Dec 18Last Quarter– Dec 26

Planets:

Mercury – Behind Sun

Venus, Saturn & Jupiter – Getting lower in the Southwest in the early evening. Mars – Becoming visible in morning eastern sky.

Moon:

New- Dec 031st Quarter- Dec 10Full- Dec 18Last Quarter- Dec 26

Total Solar Eclipse Dec 4th over Antarctica. Not even a partial in the US.

Planets:

Mercury – Behind Sun

Venus, Saturn & Jupiter – Getting lower in the Southwest in the early evening. Mars – Becoming visible in morning eastern sky.

Moon:

New– Dec 031st Quarter– Dec 10Full– Dec 18Last Quarter– Dec 26

Total Solar Eclipse Dec 4th over Antarctica. Not even a partial in the US.

Winter Solstice Dec 21, 7:59 am. Sun farthest south, shortest daylight 9hr 48min (6:59 am – 4:47 pm).

Meteor Showers:

Geminids peak on 14th. The bright Moon sets ~ 3am. ~ 150 meteors/hour possible! Ursids peak on 22nd. The nearly full moon will effectively obscure whatever it produces (5-10/hr).

James Webb Space Telescope: Launch scheduled for Dec 22 (delayed after clamp band release "incident"!)

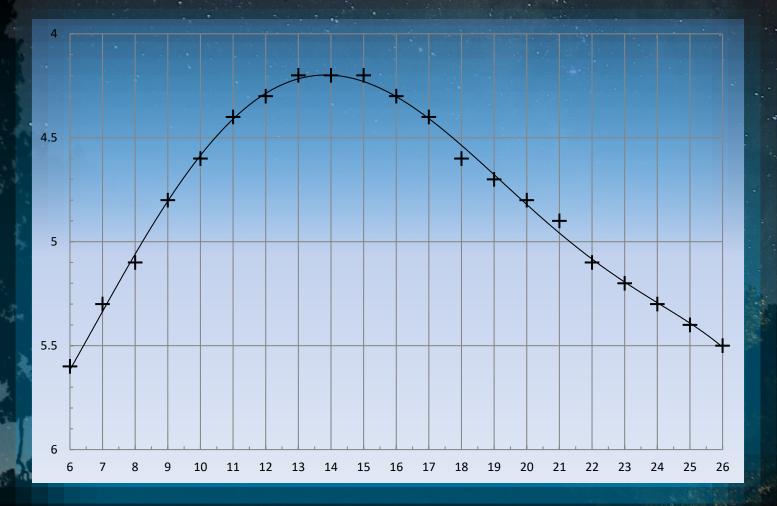

Comet C/2021 A1 (Leonard) possibly brightening to naked-eye visibility!

Comet C/2021 A1 (Leonard)

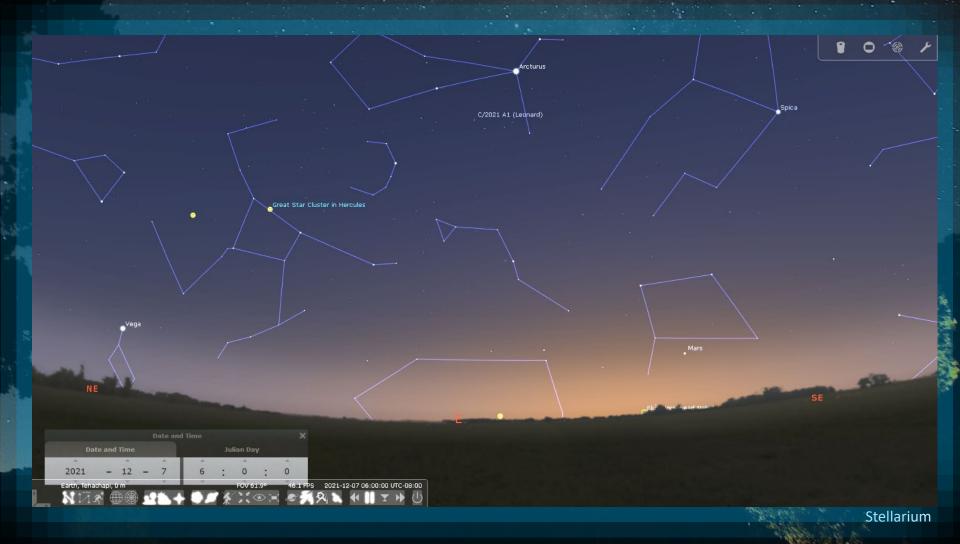

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!

Claude Plymate

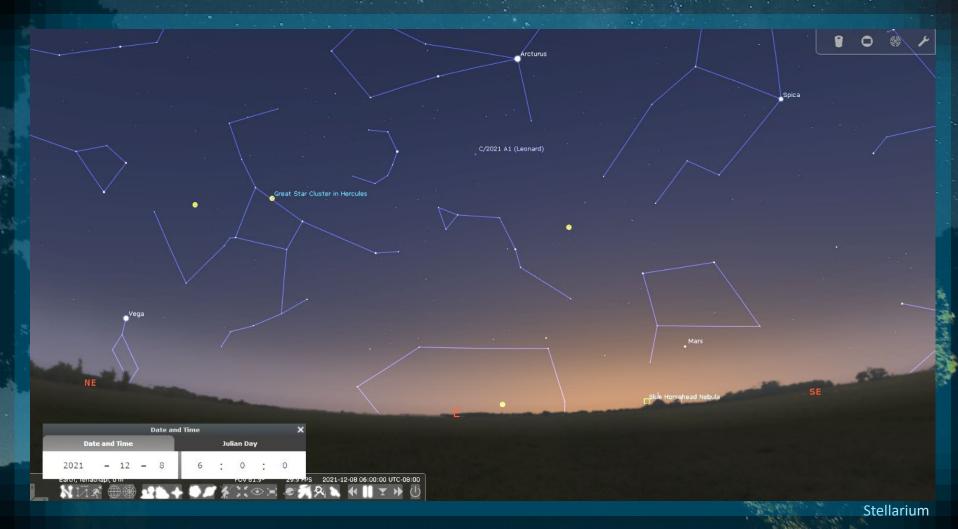

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.

Arcturus

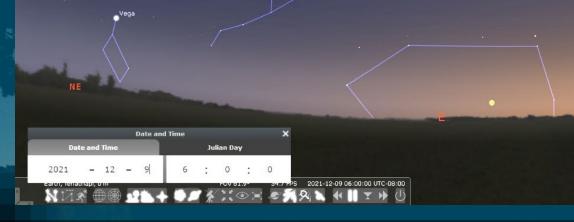

C/2021 A1 (Leonard)

Comet C/2021 A1 (Leonard)

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!

Great Star Cluster in Hercules

• Getting lower in the morning sky and disappears around the 12th.

Stellarium

 \frown

Spica

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.

C/2021 A1 (Leonard)

Comet C/2021 A1 (Leonard)

• Peak brightness predicted around mid-month.

Great Star Cluster in Hercule

- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.

Stellarium

 \bigcirc

Spica

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.
- Reemerges in the evening sky after the 16th.

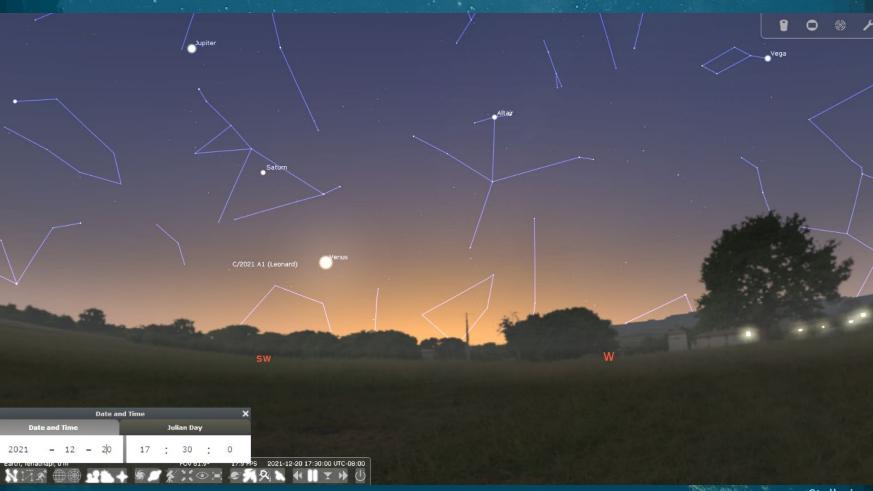

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.
- Reemerges in the evening sky after the 16th.

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.
- Reemerges in the evening sky after the 16th.

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.
- Reemerges in the evening sky after the 16th.

Earth, Tehachapi, D

Comet C/2021 A1 (Leonard)

- Peak brightness predicted around mid-month.
- Could briefly become naked-eye visible!
- Getting lower in the morning sky and disappears around the 12th.
- Reemerges in the evening sky after the 16th.

 \frown

- Solar activity is picking up.
- Cycle 25 started 2020 with Solar Max expected ~ 2024 2025.
- Diagnostics continue to look like a repeat of cycle 24. Expect weak maximum.
- Sun's southern Hemisphere continues produce more activity than the North.

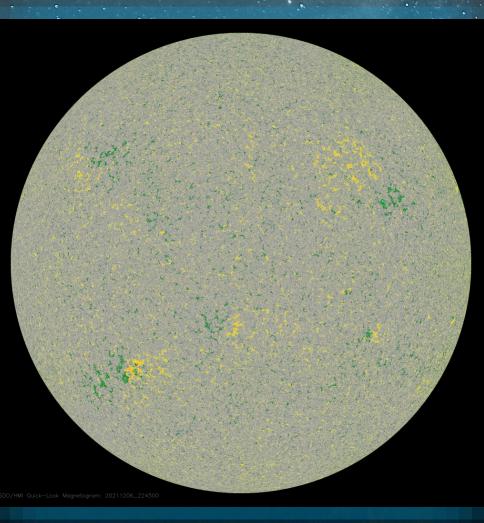

- Solar activity is picking up.
- Cycle 25 started 2020 with Solar Max expected ~ 2024 2025.
- Diagnostics continue to look like a repeat of cycle 24. Expect weak maximum.
- Sun's southern Hemisphere continues produce more activity than the North.

SDO (Solar Dynamics Observatory) Helioseismic and Magnetic Imager (HMI).

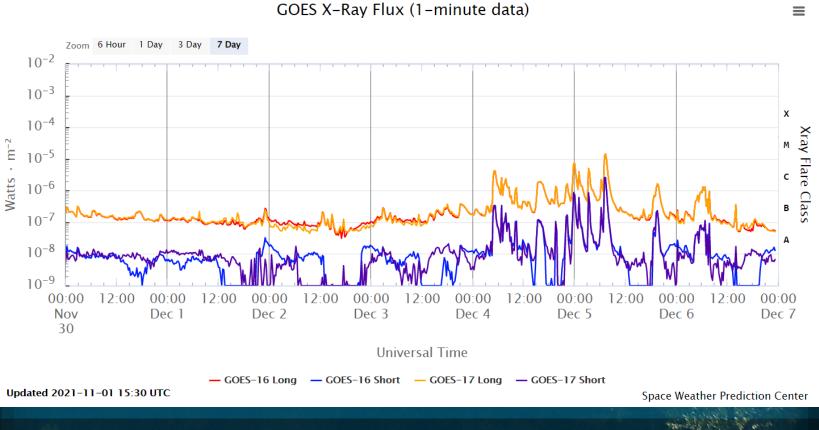

AR12904

- Solar activity is picking up.
- Cycle 25 started 2020 with Solar Max expected ~ 2024 2025.
- Diagnostics continue to look like a repeat of cycle 24. Expect weak maximum.

- Sun's southern Hemisphere continues produce more activity than the North.

NOAA/SWPC/GOES X-Ray Flux

- Solar activity is picking up.
- Cycle 25 started 2020 with Solar Max expected ~ 2024 2025.
- Diagnostics continue to look like a repeat of cycle 24. Expect weak maximum.
- Sun's southern Hemisphere continues produce more activity than the North.

Space Weather Prediction Center

NOAA/SWPC/GOES X-Ray Flux

- Solar activity is picking up.
- Cycle 25 started 2020 with Solar Max expected ~ 2024 2025.

Coronal

Hole

- Diagnostics continue to look like a repeat of cycle 24. Expect weak maximum.
- Sun's southern Hemisphere continues produce more activity than the North.

The 171 Å bandpass is sensitive to the Fe XII at ~ 1,000,000 K and Fe XXIV at 20,000,000 K.

Coronal Holes are source the of the "Fast Solar Wind" at ~ 800 Km/s, about twice the speed of normal "slow Solar Wind."
