

February 2023 Astronomy Report

- Moon:
 - Phases
- Planets:
 - V, M, J visible every evening; U, N with binoculars
 - Mars high in sky in Taurus all month
 - Mercury visible in early morning early February
 - Saturn not visible, conjunction with Sun on 16th, reappears in morning sky next month
- Meteors:
 - none this month
- Comets:
 - C/2022 E3 (ZTF)
- Constellations:
 - Messier Marathon, Winter Hexagon

Moon - Phases

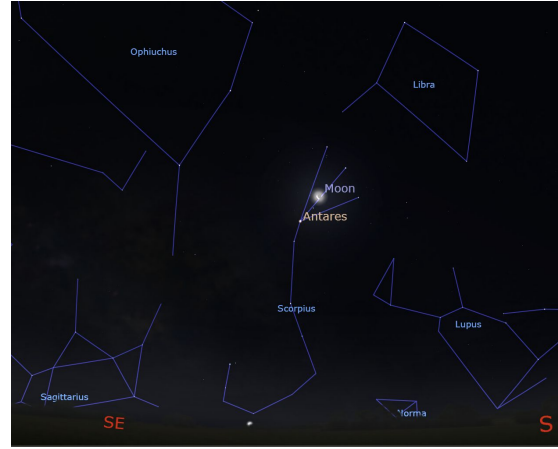

February 5 - Full Moon

February 4 at apogee (252.5K miles)

February 13 - Last Quarter

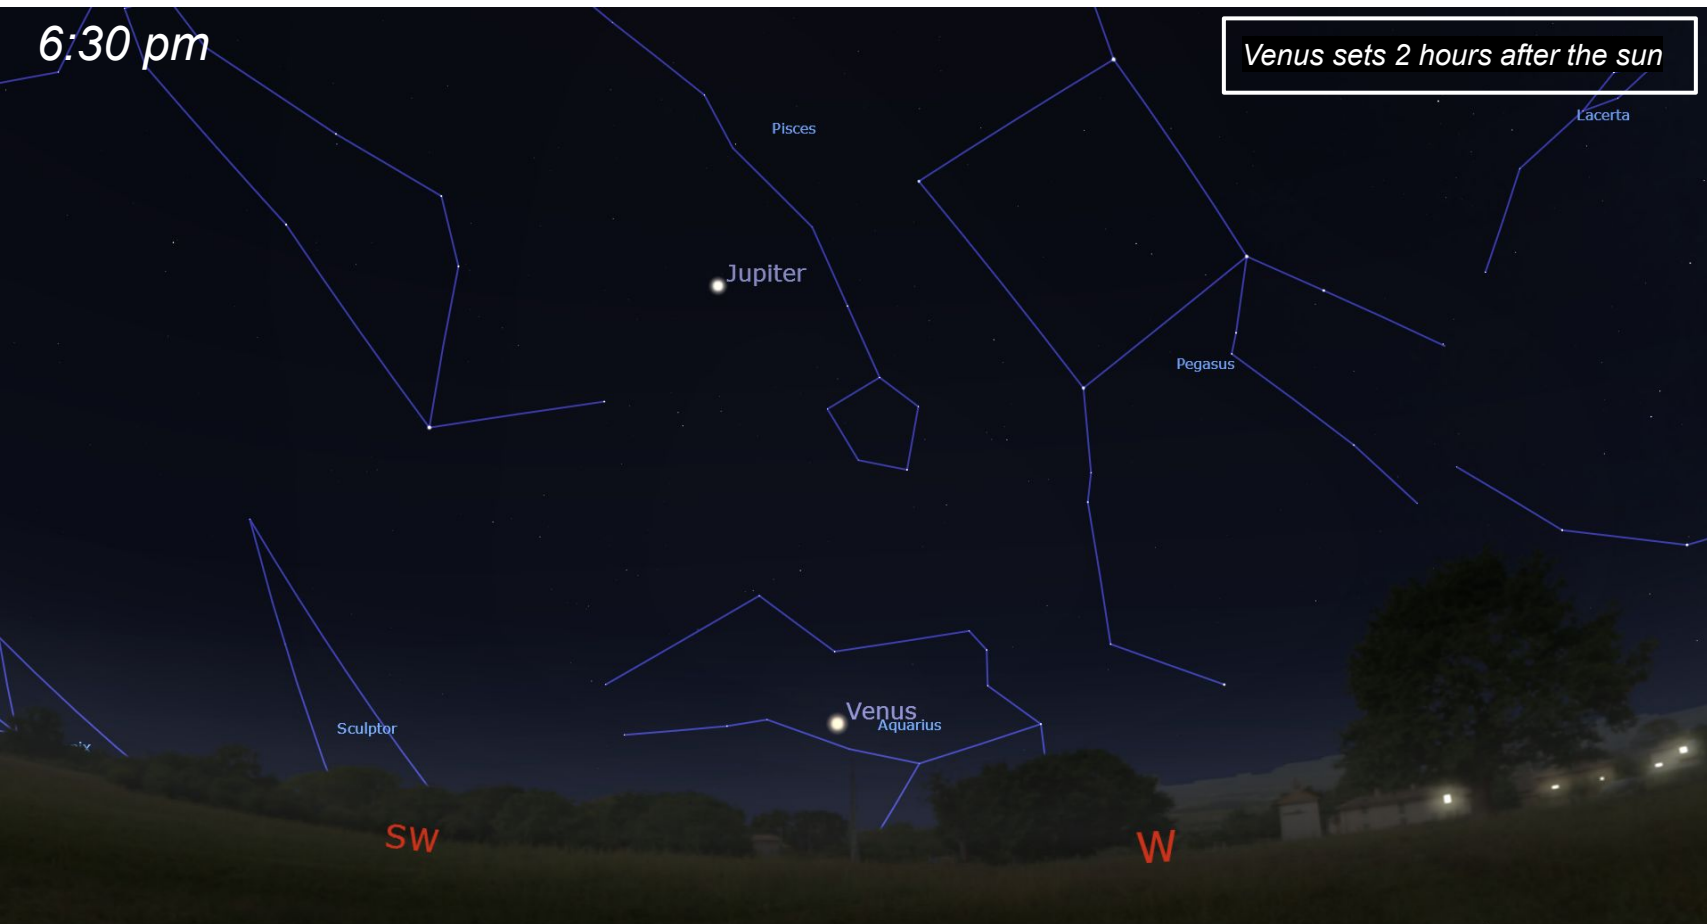

February 19 - New Moon
at perigee (222.6K miles) on 19th

February 27 - First Quarter

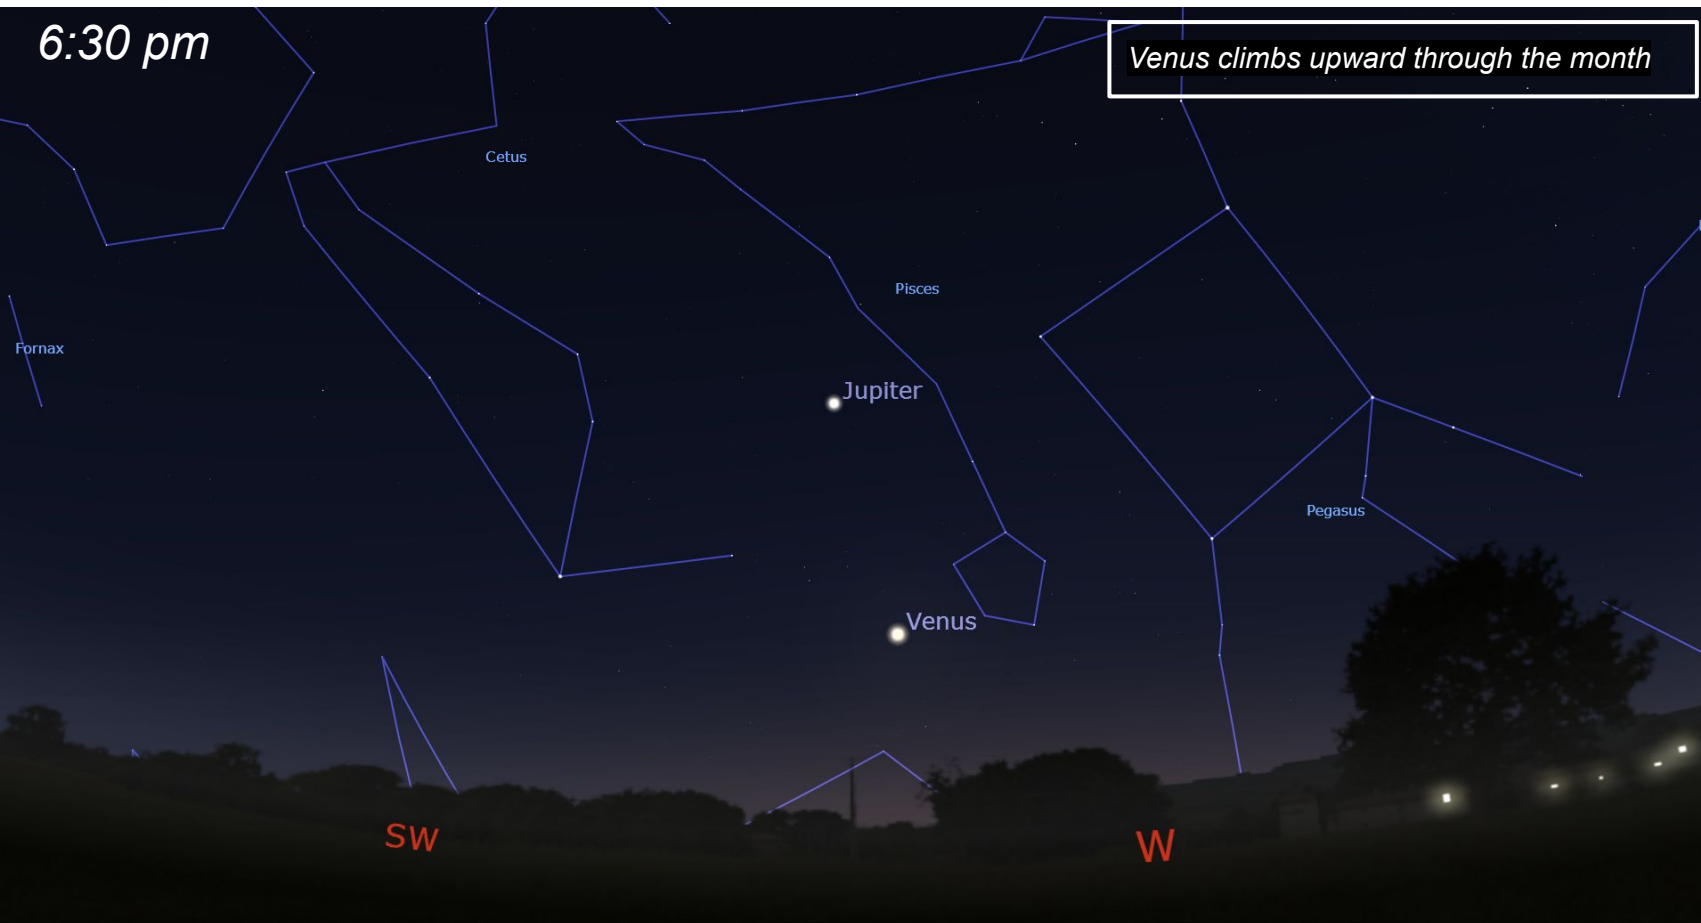

Planets - Jupiter & Venus, February 1

Planets - Jupiter & Venus, February 14

6:30 pm

Venus climbs upward through the month

Planets - Jupiter, Venus, crescent Moon, February 21

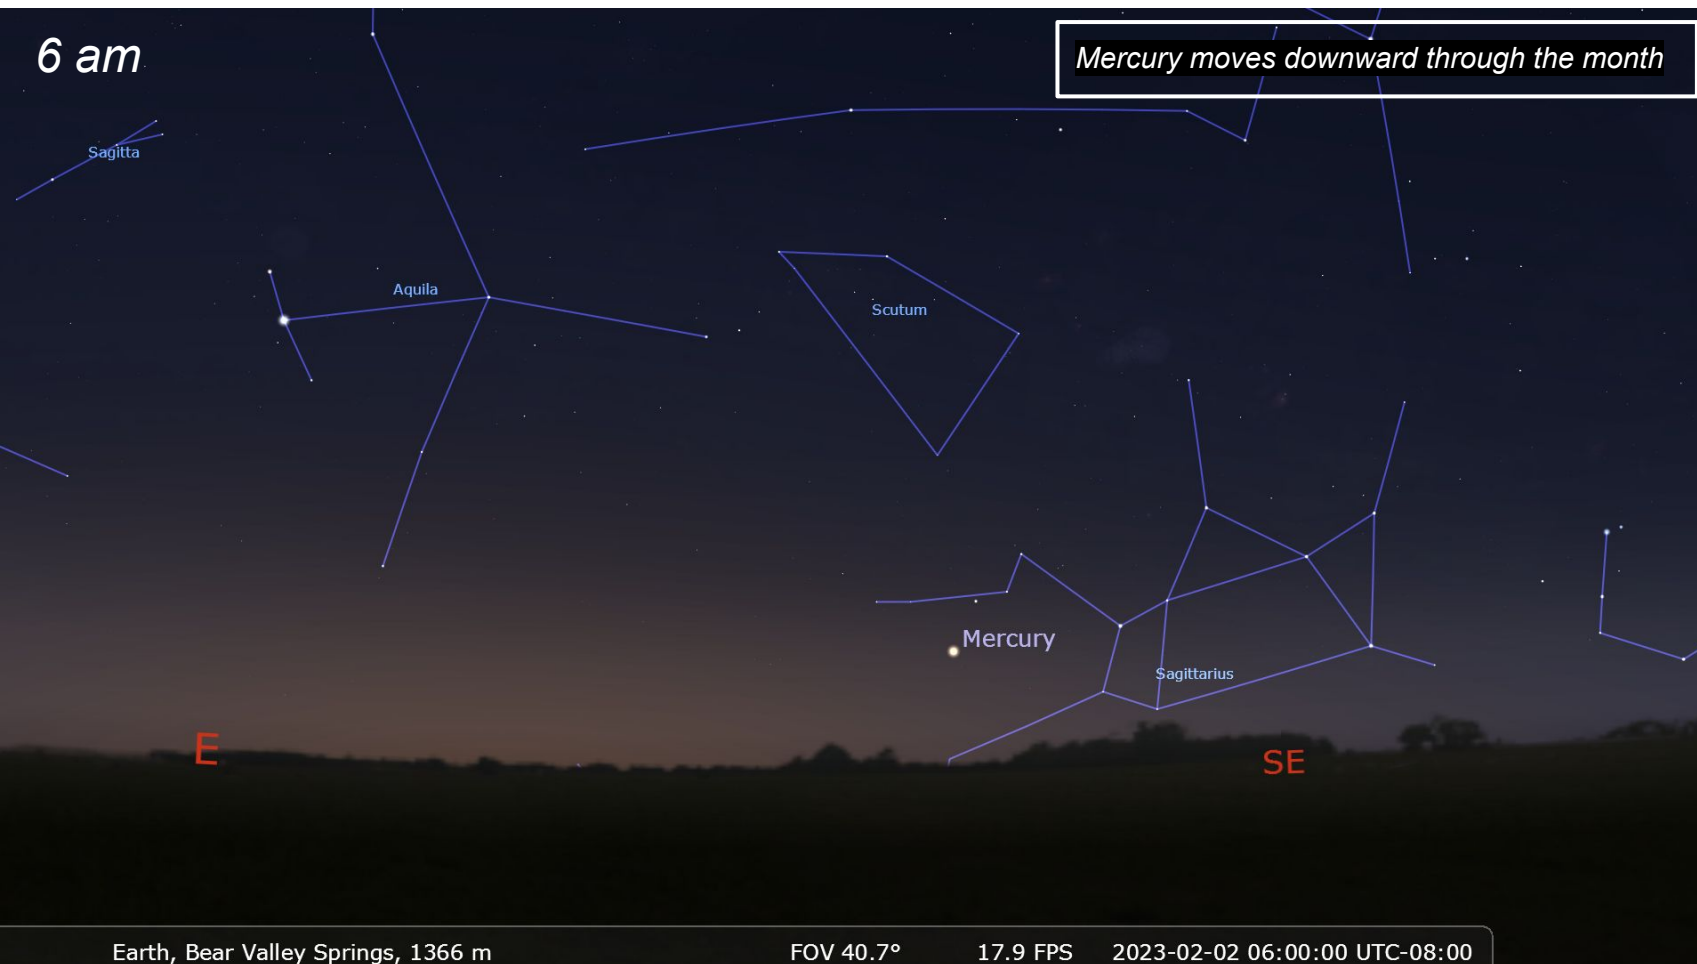

Planets - Moon/Mars & Jupiter/Venus, February 27

7 pm

Venus climbs upward through the month

Planets - Mercury, February 2

Planets - Neptune, February 2

Planets - Uranus, February 23

8 pm

Between Cetus & Aries all month

Uranus

Aries

Comets - C/2022 E3 (ZTF)

- closest to Earth on February 1 (26 million miles)
- visible in the evening, fading during the month
- rapid motion - 6 deg per night first week of Feb, moving south

photo by Sean Spratt

all times 8 pm

February constellations

Dark Sky Star Party - Amberwood Ct

Feb 18th

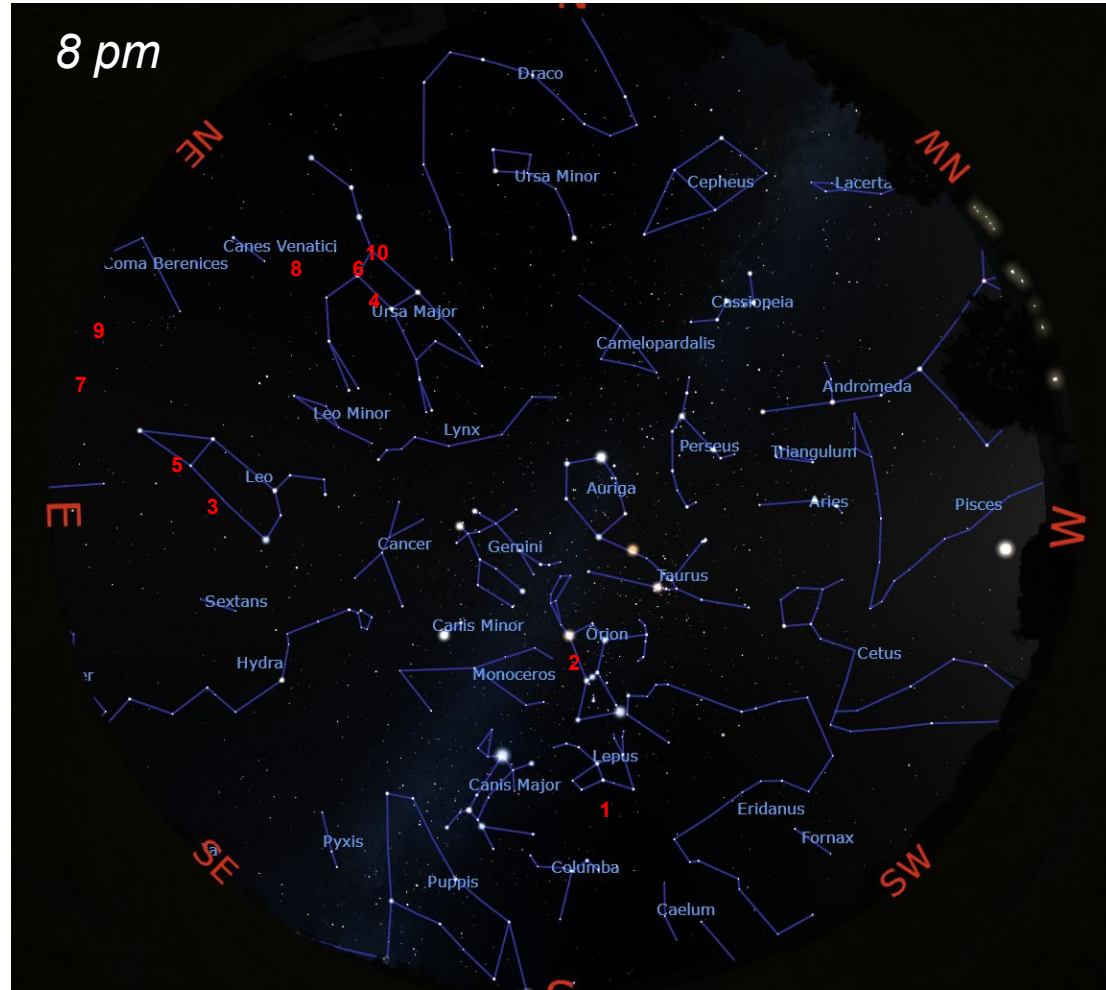

Auriga, Camelopardalis, Canis Major, Columba, Gemini, Monoceros, Puppis

Messier Marathon

- 1 - M79
- 2 - M78
- 3 - M95, M96, M105
- 4 - M108
- 5 - M65, M66 (Leo Triplet)
- 6 - M109
- 7 - M84, M86, M98, M99
- 8 - M106
- 9 - M100 (Blowdryer Galaxy), M85
- 10 - M40

all M objects visible in Northern Hemisphere in a single night mid-March to early April
